The graph shows a rider's height, in metres, on a Ferris wheel in terms of time, in minutes.

- What are the maximum and minimum heights for the rider?
- Write an equation for the rider's height, $h(t)$, in terms of time.
- Write an equation for $h'(t)$.
- At what rate is the rider's height changing when $t = 4$? $t = 28$?
- Is the rider's height increasing or decreasing when $t = 15$? How quickly is it changing?
- What is the maximum rate at which the rider's height is changing?

The Calculus of Friendship Steven Strogatz,2011-03-07 The Calculus of Friendship is the story of an extraordinary connection between a teacher and a student as chronicled through more than thirty years of letters between them What makes their relationship unique is that it is based almost entirely on a shared love of calculus For them calculus is more than a branch of mathematics it is a game they love playing together a constant when all else is in flux The teacher goes from the prime of his career to retirement competes in whitewater kayaking at the international level and loses a son The student matures from high school math whiz to Ivy League professor suffers the sudden death of a parent and blunders into a marriage destined to fail Yet through it all they take refuge in the haven of calculus until a day comes when calculus is no longer enough Like calculus itself The Calculus of Friendship is an exploration of change It s about the transformation that takes place in a student s heart as he and his teacher reverse roles as they age as they are buffeted by life itself Written by a renowned teacher and communicator of mathematics The Calculus of Friendship is warm intimate and deeply moving The most inspiring ideas of calculus differential equations and chaos theory are explained through metaphors images and anecdotes in a way that all readers will find beautiful and even poignant Math enthusiasts from high school students to professionals will delight in the offbeat problems and lucid explanations in the letters For anyone whose life has been changed by a mentor The Calculus of Friendship will be an unforgettable journey

Statistical Methods in Water Resources D.R. Helsel,R.M. Hirsch,1993-03-03 Data on water quality and other environmental issues are being collected at an ever increasing rate In the past however the techniques used by scientists to interpret this data have not progressed as quickly This is a book of modern statistical methods for analysis of practical problems in water quality and water resources The last fifteen years have seen major advances in the fields of exploratory data analysis EDA and robust statistical methods The real life characteristics of environmental data tend to drive analysis towards the use of these methods These advances are presented in a practical and relevant format Alternate methods are compared highlighting the strengths and weaknesses of each as applied to environmental data Techniques for trend analysis and dealing with water below the detection limit are topics covered which are of great interest to consultants in water quality and hydrology scientists in state provincial and federal water resources and geological survey agencies The practising water resources scientist will find the worked examples using actual field data from case studies of environmental problems of real value Exercises at the end of each chapter enable the mechanics of the methodological process to be fully understood with data sets included on diskette for easy use The result is a book that is both up to date and immediately relevant to ongoing

work in the environmental and water sciences Modeling Life Alan Garfinkel, Jane Shevtsov, Yina Guo, 2017-09-06 This book develops the mathematical tools essential for students in the life sciences to describe interacting systems and predict their behavior. From predator-prey populations in an ecosystem to hormone regulation within the body, the natural world abounds in dynamical systems that affect us profoundly. Complex feedback relations and counterintuitive responses are common in nature; this book develops the quantitative skills needed to explore these interactions. Differential equations are the natural mathematical tool for quantifying change and are the driving force throughout this book. The use of Euler's method makes nonlinear examples tractable and accessible to a broad spectrum of early-stage undergraduates, thus providing a practical alternative to the procedural approach of a traditional Calculus curriculum. Tools are developed within numerous relevant examples with an emphasis on the construction, evaluation, and interpretation of mathematical models throughout. Encountering these concepts in context, students learn not only quantitative techniques but how to bridge between biological and mathematical ways of thinking. Examples range broadly, exploring the dynamics of neurons and the immune system through to population dynamics and the Google PageRank algorithm. Each scenario relies only on an interest in the natural world; no biological expertise is assumed of student or instructor. Building on a single prerequisite of Precalculus, the book suits a two-quarter sequence for first- or second-year undergraduates and meets the mathematical requirements of medical school entry. The later material provides opportunities for more advanced students in both mathematics and life sciences to revisit theoretical knowledge in a rich, real-world framework. In all cases, the focus is clear: how does the math help us understand the science?
